

Data Set 1: - <https://shorturl.at/6wqDC>

Data Set2: - <https://shorturl.at/NNpl0>

1. Import the data into Power BI and use Power Query Editor

Check for the relationships between the tables in the model view if there is no relationship between the tables, create a relationship between the tables.

2. Import the data into Power BI and use Power Query Editor to:

Remove blank rows (If any)

Remove any duplicate rows.

Remove any unwanted columns

3. Replace the blank cells in the ship_region column with "Not Known".

4. Change all the values in the customer ID column to lowercase. 5.

Create a new column in the order details table named as "Total Amount", which will be equal to "Unit Price" * "Quantity".

6. Create another column in the order details table named as "Final Amount," which will be equal to "Total Amount" * (1- Discount) 7. Create a new table named "Final Table" which will have all the columns from the orders table and the sum of quantity and "Final Amount" for all the different order IDs. (Use the merge queries option)

8. Find the top 5 countries based on the "Final Amount". Visualize with the help of a chart.

9. For different ship methods (Ship_via) find the average freight charges and visualize them with the help of a chart.

10. For different years, find the total amount(before discount) of sales in the "Germany" country. Visualize with the help of a chart. (use ship_country to find the country of customers)

11. Find the total number of customers who ordered from the different countries. (use ship_country to find the country of customers)

Additional :

For every ship_country, find the average delivery time (Orderdate - Shipdate) in days. Visualize the countries with the top 5 highest delivery times.
